

1.1 WiMax Access Method

WiMax access ("**WiMAX**") access enables remote sites to be connected to the Business VPN using wireless technology. It is used in a restricted group of countries to improve the Business VPN Service's geographic coverage. It has country-specific characteristics and is available for Business VPN Small only. If Customer elects to purchase WiMAX access to enable access to the Orange MPLS Network, then Orange will provide, install, and manage the CE and the port configured to support the DSL access downstream speed. The customer will however need to provide authorization to mount an external WiMAX antenna to support the service. This service will connect to the MPLS network via the public Internet.
